Python is 3 things, a language, a standard library and an execution engine. PHP was 5 to 7, Perl was 5 to 6. AngularJS? Once they get over this change hump, the community can settle down, accept minor losses in backward compatibility in the name of innovation and plan for change. With CPython now being on GitHub, that can mean 1 of 2 things, the community argues about features on the issue tracker (see other core language projects) or, it means that more people raise pull-requests, fix bugs and improve Python platform support. Is that a bit? I think every major/language project has a change hump. .NET was 1.1 to 2. Therefore, he concludes, all that burns is wood. OK, so that is totally illogical, but if 4.0 were to come out soon - which features would you want to see? Before we start the list, it's important to remind ourselves what is in the CPython project. Exciting times for the Python community. Python 2.7 was the last release of the 2.x series, so by Sir Bedevere logic, Python 4.0 will be the next major release after 3.7. All wood burns, states Sir Bedevere. The API was added in 3.6, but we're yet to see an implementation out there of the API. Python 3.3 was the first release of the 3.x series to include fast decimal types, virtualenv as a core function and namespace package support. Today, most major packages on PyPi that support Python 3, like requests support 3.3. The early adopters that tried Python 3 between 2008 and 2012, may have walked away with the perception that it isn't ready. Each of these compromises on functionality (or correctness of the language) over speed. Having a first-class JIT plugin architecture for CPython would bridge the performance and compatibility needs together and efforts spent on PyPy, Numba etc could be directed into the main CPython ecosystem. The good news? In C# 6.0, Python has x if y else z as per PEP-308, not likely to have a specific ref.
